

AM

Al Manara

Property Management System

A single system for the entire tenancy lifecycle — leasing, post-dated cheque collection, renewals and maintenance — where every procedure is guided step by step, every approval is recorded, and nothing of value can happen by accident.

450

units under management

6

buildings

5

guided procedures

100%

of actions audited

THE PROBLEM

Portfolios are not lost to bad decisions. They are lost to missed steps.

A cheque sits in the safe past its due date. A renewal notice goes out too late to be enforceable. Rent is raised above the legal cap and has to be refunded. Work is committed to a contractor before anyone approved the cost. None of these are decisions — they are steps that someone did not know about, or did not get to in time.

Written procedures do not fix this, because they depend on staff remembering that the procedure exists.

Al Manara PMS puts the procedure inside the software. Each task is presented one step at a time, states exactly what is required, and will not advance until that step is complete and correct.

back-dated deposits

8

actions requiring
manager approval

WHAT IT DOES

Core capabilities

Eleven working areas, each visible only to the staff whose role permits it.

DAILY VIEW

Dashboard

Opens on what needs attention today. Money at risk is surfaced above everything else, followed by occupancy, rent roll, collections, arrears and expiries — and the actions this particular employee is allowed to take.

PORTFOLIO

Properties & units

Six buildings, 450 units. Every unit carries floor, type, size, parking and market rent, with live status — occupied, vacant, reserved or under maintenance — and its full tenancy history.

RECORDS

Tenants

Individuals and companies with Emirates ID, passport, nationality and trade licence. Each record gathers every contract, cheque and maintenance request in one place.

LEASING

Contracts

Term, rent, deposit, commission, Ejari registration and document checklist. Created through a guided eight-step process — and no contract becomes active until a manager has approved it.

COLLECTION

Cheque register

Every post-dated cheque tracked individually from pending through deposited to cleared, or bounced and replaced. Cheques nearing their due date raise a task against a named employee automatically.

FINANCE

Payments

Receipts across rent, deposit, commission, fees and maintenance, by cheque, cash, transfer or card — reconcilable by category and period.

RETENTION

Renewals

Contracts inside 90 days of expiry surface automatically. The process handles both renewing on new terms and non-renewal, each with its own legal requirements checked.

OPERATIONS

Maintenance

Work orders with category, priority and an SLA deadline derived from that priority. Vendor assignment, quotations, and a spend ceiling above which a manager must approve before work is committed.

CONTROL

Approvals queue

Everything waiting on a manager in one place — what is being asked, by whom, the amount at stake and the full context. Approved or rejected with a written reason.

ACCOUNTABILITY

Audit log

Every action ever taken: who, what, which record, when, from where, and the exact values before and after. Filterable, and not editable from the interface.

WORKLOAD

Task list

The system creates the work rather than waiting to be asked — cheques to bank, renewals to begin, approvals to decide — assigned to a named person with overdue items escalated.

INSIGHT

Reports

Occupancy, rent roll, collection performance, arrears and the expiry pipeline, with a twelve-month forecast built from cheques already held.

THE DIFFERENCE

Procedures that cannot be skipped

Five critical tasks are delivered as guided sequences rather than blank forms.

Procedure	Steps	What it guarantees
New tenancy	8	The unit is still vacant, the tenant is properly identified, the cheque schedule reconciles to the rent, and every required document is accounted for.
Renewal or exit	6	Payment history and open maintenance are reviewed, the rent cap is respected, and notice periods are served and evidenced.
Maintenance intake	5	The problem is described usefully, access is arranged, and spend is quoted and approved before work begins.
Banking a cheque	4	The physical cheque is verified against the record before anyone leaves for the bank.
Returned cheque	4	The tenant is informed, the reason is documented, and a replacement deadline is set.

How a guided procedure behaves

1	2	3	4	5
One step	Live checklist	Locked ahead	Typed proof	Recorded
Only the current step is shown, with plain-language guidance.	Outstanding items are listed as they are resolved.	Later steps stay closed until this one is valid.	The employee types the cheque or unit number to confirm.	The action is written to the permanent audit trail.

WHY THE TYPED CONFIRMATION MATTERS

Every procedure ends by asking the employee to type a specific identifier — the cheque number, the unit number, the contract reference. It is the single cheapest control against the most expensive category of error: doing the right thing to the wrong record.

Controls and safeguards

Three independent layers, so no single person can move money unchecked.

1. Role-based access

Six roles checked against 22 named permissions. Staff see only what their role permits — both in the menu and on the page itself.

Role	Responsibility
Administrator	Full access, including staff accounts and roles
Manager	Full operational access — and the only role that can decide approvals
Accounts	Banks cheques, records returns and payments, runs reports — cannot create contracts
Leasing	Contracts, renewals and tenants — cannot bank cheques
Maintenance	Work orders and assigned tasks only
Auditor	Sees everything, changes nothing

SEPARATION OF DUTIES

Banking a cheque and approving an exception are deliberately held by different roles. The person who commits money is never the person who authorises it.

2. Mandatory approval

Eight actions cannot take effect on one person's authority. Each is queued to a manager with full context and decided with a written reason.

Action requiring approval	Threshold
New tenancy contract	Always, before activation
Renewal	Always, before the new term starts
Change to agreed rent	Any change
Early termination	Always
Holding a cheque past its due date	Always
Replacing a bounced or cancelled cheque	Always
Maintenance spend	Above AED 1,000
Deposit refund	Always

3. Complete audit trail

Every change writes a permanent entry naming the person, the action, the record, the time, the originating address, and the exact before and after values. Nothing in the interface can alter or remove it — which is what makes the log worth having in a dispute.

Rules the system enforces on its own

These are not reminders or warnings. Work cannot proceed until each is satisfied.

Tenancy and rent

- Rent increases are capped at **5%**; anything higher requires a written justification recorded against the renewal.
- Non-renewal requires confirmation that **90-day notice** was served to the tenant in writing.
- Contracts that expired more than 30 days ago are escalated to a manager rather than processed normally.
- A contract start date cannot be back-dated more than 30 days.
- The unit must still be vacant at the moment of submission — a unit let in the meantime blocks the contract.

Cheques and collection

- The physical cheque must be confirmed retrieved and matched on number, bank, amount and date before banking.
- A deposit back-dated more than **14 days** is refused and escalated to a manager.
- A deposit can never be recorded with a future date.
- Cheque numbers must be 4–9 digits, and the same number cannot be recorded twice at one bank.
- The cheque schedule must reconcile exactly to the agreed annual rent.
- A returned cheque cannot be closed until the tenant is confirmed informed and a replacement deadline is set.

Maintenance

- Spend of **AED 1,000 or more** requires a written quotation attached before work is committed.
- The fault description must be substantive — the vendor works from that text.
- Access arrangements are mandatory, and emergencies require the safety risk to be described.

Tenant identity

- Emirates ID must match the official format.
- Mobile numbers must be valid UAE numbers.
- Company tenants must supply a trade licence number.

Built for the people who use it all day

Works on any device

Full desktop layout for office work, and a genuine mobile layout for staff on site inspecting units or standing at the bank counter.

Light and dark themes

Switchable to suit the environment, applied instantly with no flicker, remembering each employee's preference.

Readable by design

Every colour combination in the system has been measured against the WCAG AA accessibility standard in both themes.

Plain language

Requirements are written as instructions to a person — not error codes — so new staff can follow a procedure correctly on their first day.

Keyboard accessible

Fully navigable without a mouse, with clear focus indication for staff working at speed.

Protected access

A site-wide password sits in front of the system, with individual staff sign-in behind it and every session tied to a named person.

Where this stands today

The system is complete and working as a demonstrator: every screen, procedure, rule, approval path and audit behaviour described in this document is built and running, and can be walked through end to end against a realistic 450-unit portfolio.

Three items remain before live tenancy data is handled. They are deliberately isolated, so the permission model, rules, approvals and audit trail all carry over unchanged.

Item	Today	For live use
Sign-in	Staff account selection	Company email and password with a one-time code, restricted to the office network or VPN
Storage	Structured files on the server	A managed database with backup and recovery
Documents	Recorded as checklist entries and reference numbers	Uploaded files stored against each contract

WHAT THIS MEANS COMMERCIALLY

The parts that take longest to get right — the procedures, the rules, the approval matrix and the audit trail — are already built and demonstrable. The remaining work is infrastructure, which is well understood and scoped.
